

My master research

- Fashion designer > master game technologies
- Running these guilds as part of my master research
- Needs to be recorded for documentation
- Your input is my data
- Helps me graduate ☺
- In turn: Ask me for help, feedback etc on your costume work!

Lets skip the introduction, you all know me by now

If new people:

For anyone who is new, I am a fashion designer and I am currently doing the masters here at buas

I run these guilds as part of my research so your input is my data and will help me graduate

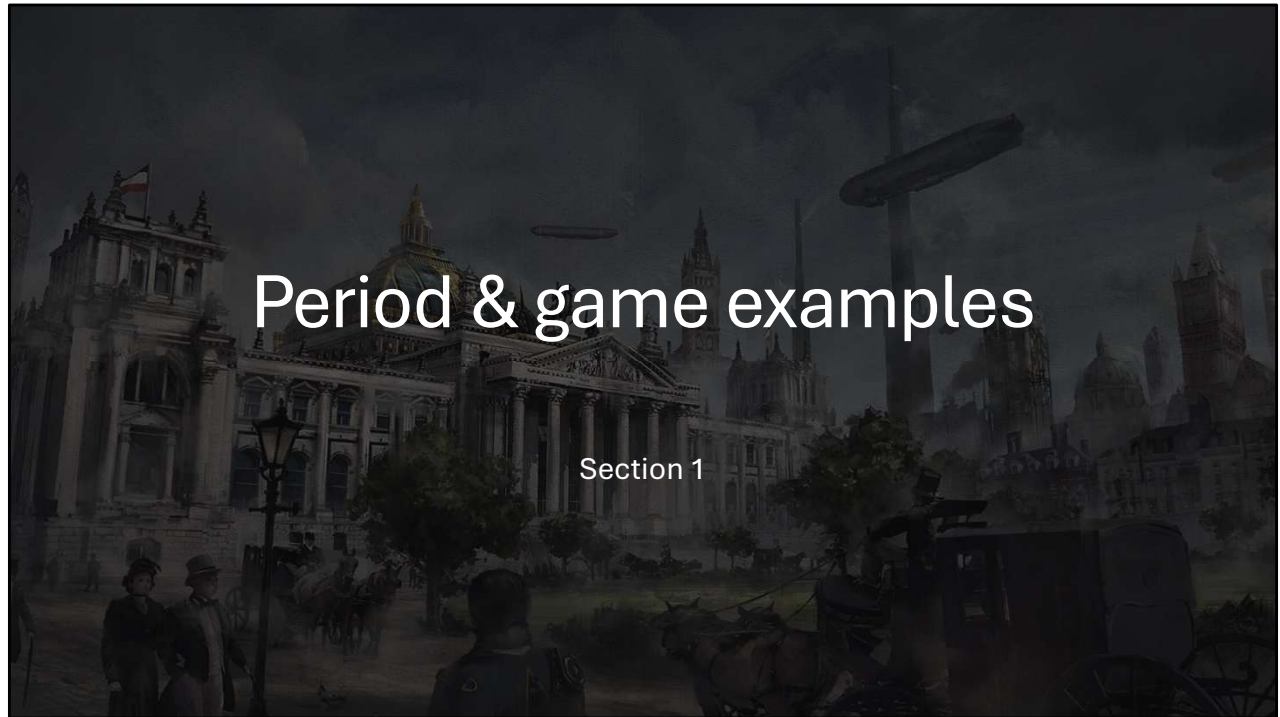

Agenda

1. Period & game examples
2. Silhouette & key garments
3. Social hierarchy
4. Materials, textiles & dyes
5. Construction & details
6. Special topics
7. Discussion & reflection

A quick overview of what we're covering today, same topics as last week but focused on the Victorian era
The special topic is corsets

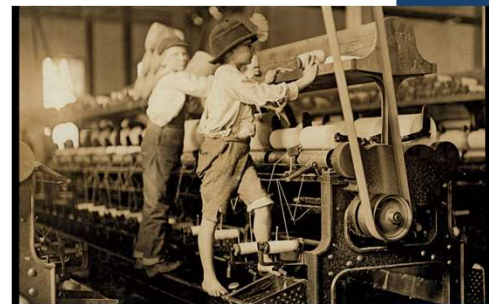

This guild session will be a little more interactive to save my throat from dying
There will be a few questions in between the topics for us to discuss together

Lets start with the period introduction and some game examples

Introduction

- Steampunk / gothic aesthetic foundation
- Structure, corsetry and tailoring = understanding garment construction
- Industrial revolution = machines meet fashion
- Vampires, detectives and mad scientists all live here

Victorian fashion is when clothing became genuinely engineered.
This period had a bunch of new inventions and factories made following with current fashion trends more accessible

Period explanation

- Industrial Revolution: Late 1700s - early 1900s (roughly 1760s-1900s)
- Victorian Era: 1837-1901 (Queen Victoria's reign)
- They overlap significantly - the Victorian era happens DURING the Industrial Revolution
- Victorian = the time period and aesthetic era
- Industrial = the technological revolution happening during that time that TRANSFORMED Victorian fashion

Victorian = THE FASHION

Industrial = THE TECHNOLOGY

So victorian is the aesthetic era.

Industrial is the technological revolution that happened during it and completely transformed what people could wear and how it was made.

Victorian tells you what it looks like, Industrial tells you why it looks that way.

Period explanation

- **Early Victorian (1837-1860)** – crinoline cages, dome skirts, structured corsetry
- **Mid-Victorian (1870s-1880s)** – bustle, extreme waists, dress engineering
- **Late Victorian/Edwardian (1890s-1910s)** – S-curve silhouette, Gibson girls, rational dress movement

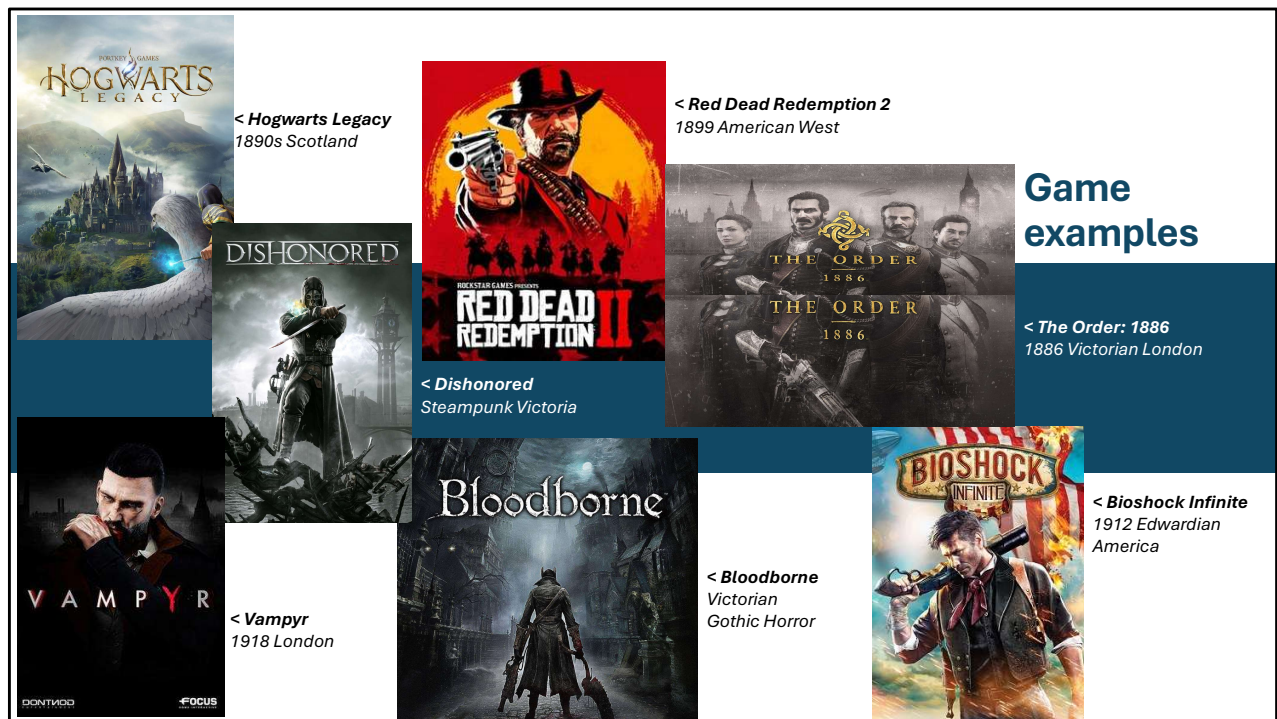

This era is divided into three distinct phases, which have three distinct silhouettes.

Early Victorian is the dome skirt era.

Mid-Victorian is peak structural complexity — the bustle, extreme waist suppression.

And late Victorian is when women start pushing back: the rational dress movement advocated for no more skeleton-deforming corsets, and they started wearing trousers. Which is a big deal for the time.

It is worth noticing how differently each game uses the period —
 Bloodborne leans gothic horror, Dishonored steampunks the Victorian base,
 Red Dead is the frontier version of the same era. Same time period, very different
 expression depending on genre and geography.

Key take-aways

- This is when clothing became **ENGINEERED**. Understanding Victorian construction teaches you how garments actually **WORK**.
- Understanding construction is essential for realistic cloth physics and armour design in games.

Victorian clothing is engineered clothing. Understanding the construction is what lets you make believable cloth physics and armour design, because you know what the garment is actually doing underneath.

Question for you

Can you name another game set in the Victorian era or with a steampunk aesthetic?

What made you recognise it as that period?

lets dive into the silhouettes and key garments

Defining silhouette

Women:

- Extreme hourglass - EVERYTHING emphasizes tiny waist
- 1820-30s: Romanticism, sleeves
- 1850s-60s: Dome skirt (crinoline cage)
- 1870s-80s: Bustle (all volume at back)
- 1890s: Gibson Girl (leg-o-mutton sleeves return, S-curve)

1831 sleeves

1886 pink
side picture
Bustle

1829 yellow
dress

Exaggerated sleeves

Dome skirt

Bustle

S-shape

Gibson Girl

Every women's silhouette change across the Victorian era is chasing the same goal: the tiniest possible waist.

What changes is how the volume around it is distributed — dome skirt in the 1850s-60s, all that volume shifts to the back with the bustle in the 1870s-80s, then the S-curve in the 1890s.

Same obsession, different engineering solution each decade.

Defining silhouette

Men:

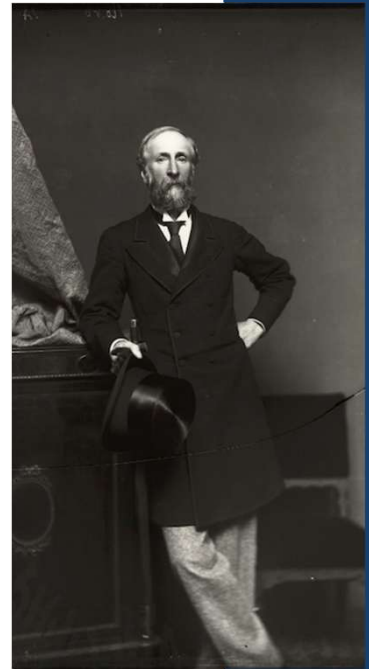

- Structured, tailored, angular
- Broad shoulders, nipped waist
- Long vertical lines
- Top hat adds height

1840 Tailcoat

1874 morning coat

1873

The defining silhouette for men stays comparatively stable.
Status reads through precision of tailoring, not through volume.
The top hat is doing a lot of visual work to add height.

Children's wear

- Children dressed like mini-adults.
- From the age of 5, boys wore suits

1865 prince and princess

1889 kid suits

Children dressed as miniature adults — no concept of children's fashion as its own thing.

If you're populating a Victorian world, your child NPCs should be dressed like small adults

Key garments

- **Corset** - THE defining garment (shapes everything else)
- **Bustle** - Creates distinctive silhouette (1870s-80s)
- **Tailcoat/Frock Coat** - Men's formal wear
- **Waistcoat** - Layering essential
- **Cravat/Bow Tie** - Neck detail (important focal point)

Corset

Bustle

Tailcoat

Waistcoat

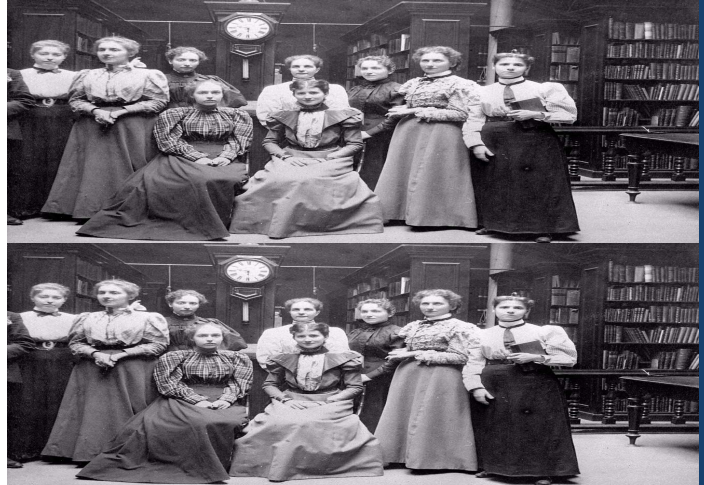

Cravat

The corset is the foundation — everything else is shaped around it. Like the bustle or the cage skirt
And the tailcoat waistcoat or cravat, are a major focal point on a male character

Working class variations

- Simpler construction, fewer layers
- Aprons, caps, practical fabrics
- Same silhouette principles, less extreme

1895 Working ladies in library of mechanics

Working class variations are the same silhouette, but fewer layers, and simpler construction.

You can't just swap fabrics onto a poor character and call it done — layer count and construction quality has to change too.

Visual recognition

Tiny waist + huge skirt OR structured tailcoat = instant Victorian

Add goggles and gears = instant steampunk

The Andor concept is set in the future but those green jackets are clearly referencing Victorian tailcoats — the silhouette gives it away immediately. If you would add some goggles and gears this would be recognised as instant steampunk

Question for you

If you had to design an NPC and communicate their social class only through clothing;

- What comes to mind?
- How would you dress them?

The next topic is the social hierarchy of this period

Source image: https://commons.wikimedia.org/wiki/File:James_Tissot_-_The_Circle_of_the_Rue_Royale_-_Google_Art_Project.jpg

Social hierarchy

ARISTOCRACY → UPPER MIDDLE → MIDDLE CLASS →
WORKING CLASS → POOR/SERVANTS

- Middle class > gained wealth
- Pushed political reforms
 - Voting rights
 - Ending slavery
 - Protection of women and children
 - New social values
- Middle class > dominant cultural influence
- No more aristocratic control

Something that makes the Victorian era different from last session — the middle class actually gained real power here.

Industrialisation created new wealth, and that newly wealthy middle class pushed for political reforms.

Costume in this period reflects a hierarchy that's actively shifting, not a fixed one.

Visual markers of status

NUMBER OF GARMENTS (More Layers = More Wealth)

- **Upper Class Woman:** 8+ garments (chemise, drawers, corset, corset cover, petticoat(s), dress, overskirt, jacket)
- **Middle Class Woman:** 5-6 garments (fewer petticoats, simpler dress)
- **Working Class Woman:** 3-4 garments (basic dress, apron, minimal undergarments)

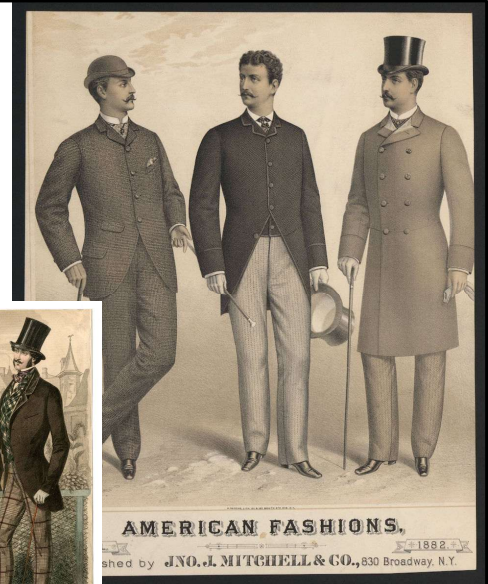

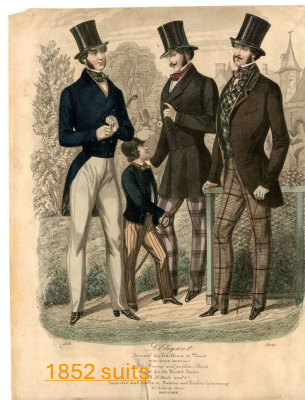

1858 Dress day/evening bodices

Layer count is your first status signal. Upper class woman: 8+ garments. Working class woman: 3-4. More layers means more costly, and means you need servants to help you dress.

Visual markers of status

TAILORING QUALITY

- **Custom tailored** = Wealth
- **Ready-made** = Middle class
- **Ill-fitting/Handed down** = Poor

If your outfit is custom tailored = that showed wealth.

Ready-made in the new factories = middle class.

Ill-fitting or handed-down = poor.

Victorian tailoring is so structured that a badly fitting suit is immediately obvious in a way that a badly fitting tunic isn't.

Visual markers of status

CLEANLINESS & CONDITION

- **Pristine, pressed** = Doesn't do manual labour
- **Clean but worn** = Respectable working class
- **Stained, torn** = Poverty or dirty work

Miners 1850

If your clothing was Pristine and pressed = it showed you don't do manual labour.
Clean but worn = respectable working class.
And Stained and torn = poverty or dirty work.
The Condition communicates occupation and status simultaneously without any dialogue needed.

Visual markers of status

COLOR CODING

- **Rich:** Jewel tones, whites (hard to keep clean = wealth), black (expensive dye)
- **Middle:** Respectable darks, modest colours
- **Poor:** Faded colours, browns, greys (hide dirt)

Colours are less reliable as a status marker than in the medieval period, specifically because of industrialisation.

Once synthetic dyes arrive in 1856, bright colours become cheap and accessible to everyone.

Pristine whites still signal wealth — they're hard to keep clean — but the colour-to-class connection is looser than it used to be.

Visual markers of status

- **ACCESSORIES = STATUS SYMBOLS:**

- **Upper:** Multiple jewellery pieces, parasol, gloves, hat with feathers
- **Middle:** Simple jewellery, practical hat, gloves
- **Lower:** Maybe a shawl, basic cap, no gloves

< Lower class

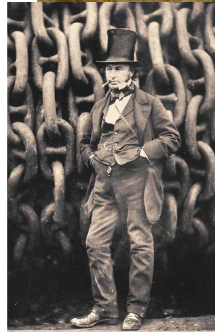

Upper class >

And example of a visual marker in accessories is Gloves—
they're impractical for any manual work, so wearing them signals immediately
that you don't do any.

Visual markers of status

INDUSTRIAL SPECIFIC MARKERS

- **Factory worker:** Plain, dark, practical, covered in factory dust
- **Factory owner:** Fine suit, top hat, pocket watch chain (visible wealth)
- **Butcher:** Middle class tailoring + practical modifications (apron)

Industrial specific markers can be seen as for example The pocket watch chain on a factory owner— it's wealth you can see at a glance. And The butcher is interesting too: middle class tailoring with a practical layer added on top.

Game design application

- **Steampunk Inventor Boss?**
Quality Victorian base + brass goggles + leather modifications
- **Street Urchin NPC?**
Oversized/torn Victorian pieces, dirt, patches
- **Aristocrat Vampire?**
Impeccable tailoring, rich fabrics, ornate details
- **Factory District Crowd?**
Simple, dark, practical, weathered

Whatever npc you design, whether it's a creature like a vampire or a poor child, you can take the respective social class's visual language and push it further

Game examples

- **Dishonored:** Clear visual hierarchy between aristocrats and street people

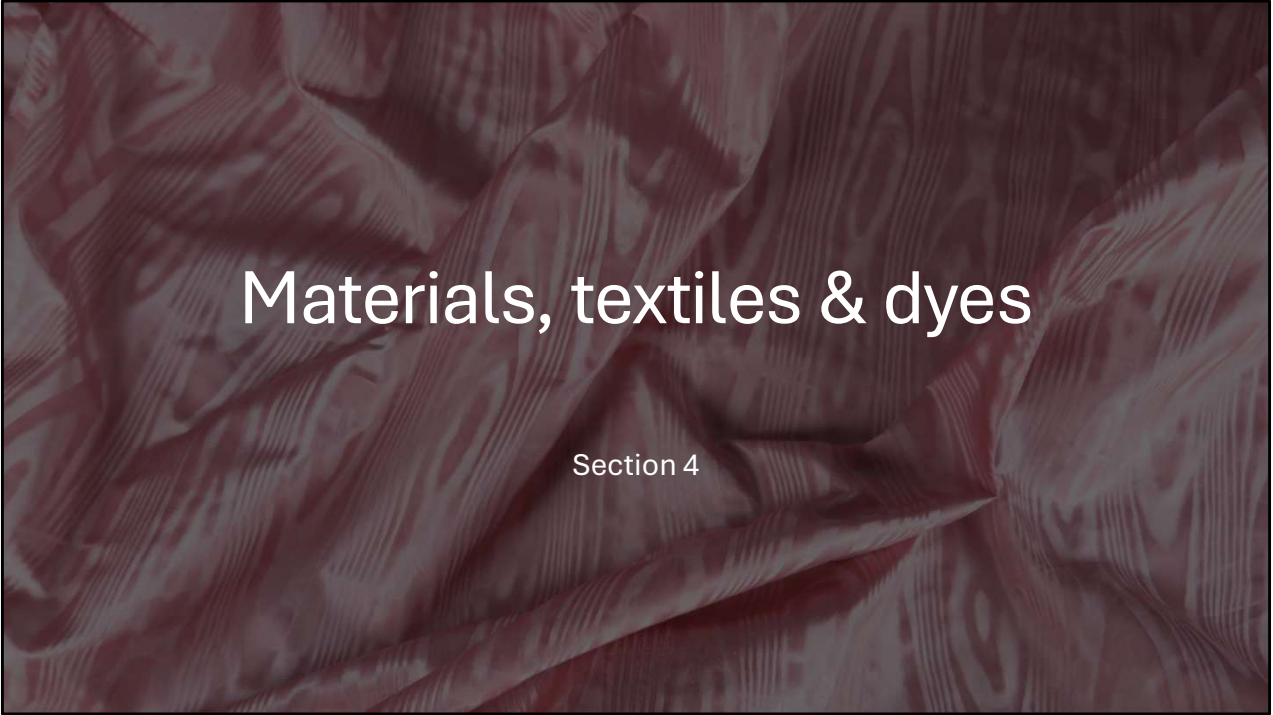

In dishonored The visual gap between aristocrats and street people is immediately readable without any lore knowledge. That's the visual hierarchy doing its job.

Question for you

- What colours do you associate with this era?
- Anything new?

Before we get into materials textiles and dyes
Im curious to know what colours you already associate with this era?
Anything new in relation to previous periods?

Materials, textiles & dyes

Section 4

Alright the next topic is materials textiles and dyes

The game changer for these topics is the industrial revolution which made mass production possible and invented a whole new range of synthetic colours

Industrial revolution > created Victorian fashion

- Sewing machines (1840s-50s) → faster construction
- Synthetic dyes (1856) → bright colours
- Mass production → affordable fashion
- Factory-made corsets, crinolines, bustles → structured garments became accessible

The Industrial Revolution didn't just happen alongside Victorian fashion, it created it.

The sewing machine, synthetic dyes, mass production — everything that defines the Victorian silhouette became accessible because of industrialisation.

Materials

NEW MATERIALS:

Cotton - Becomes CHEAP and accessible

- Previously expensive (hand-picked, hand-spun)
- Industrial mills = mass production
- Breathable, comfortable, easy to dye

Synthetic Dyes (1856 = Mauve discovered)

- EXPLOSION of colours never seen before
- Bright, consistent, affordable

Aniline dyes: Vivid purples, magentas, greens

Colour revolution: Working class can now afford bright colours

VERY toxic

Mauvine

Scheele's green

a chemist accidentally discovers mauvine while trying to make synthetic quinine, and it kicks off an entire colour revolution.

The catch: aniline dyes were extremely toxic. Arsenic-based Scheele's green caused skin ulcers and worse.

Fashion literally killed people but they just kept wearing it. Good detail for a steampunk world where the aesthetic is beautiful, but the reality is grim.

Materials

NEW MATERIALS:

Machine-made lace (1830s+)

- Previously hand-made = expensive
- Now decorates everything

Rubber/Vulcanized materials (1840s+)

- Waterproofing, elasticity
- Used in tires, rain boots, shoe soles

New texture entirely

Rubber “galoshes” – [\[link\]](#)

A new material is Machine-made lace, this meant that a luxury, only the wealthy could previously afford, suddenly decorates everything — so lace no longer reads as rich the way it would have earlier.

Before vulcanisation, they still used rubber but it turned sticky when hot and brittle when cold.

Vulcanisation fixed that and made it always flexible and usable to make a whole range of items from it

Materials

- **TRADITIONAL MATERIALS (Still used):**
- **Silk:** Still expensive but more available, taffeta popular (crisp, rustles)
- **Wool:** Still common, better quality from improved sheep breeding
- **Linen:** Undergarments, summer wear

The traditional fabrics from the previous era is still in use
The factories made labour intensive materials easier to process so these
because more accessible because of mass production

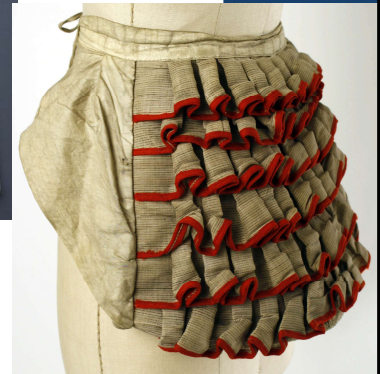

Materials

STRUCTURED MATERIALS:

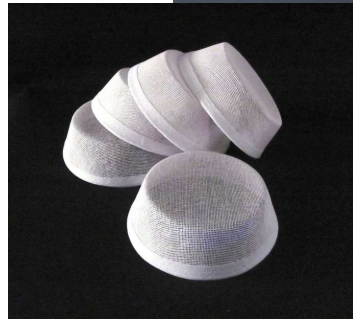

- **Steel boning** (corsets) - Previously whalebone
- **Horsehair padding** (bustles, petticoats)
- **Buckram** (hat stiffening)
- **Starch** - Makes things CRISP

Steel boning

Horsehair bustle

Buckram hat base

The structured garments of this era needed a lot of hidden internal materials such as steel boning for corsets, Horsehair padding for bustles and petticoats And buckram which is a cotton, linen or horse hair plain weave fabric which has been stiffened in starch to use as hat bases.

Fabrics

Bombazine >

Watered silk [\[link\]](#)

- Moire (watered silk) - wavy light-catching pattern
- Brocade - woven patterns, raised texture
- Velvet - directional pile, crushes beautifully
- Taffeta - crisp, rustles, holds shape
- Muslin - sheer, lightweight
- Bombazine - matte mourning fabric

< Moire

There's a few new fabrics worth knowing by name

Moire is this beautiful silk which has a water pattern which shimmers in different light.

Velvet has a directional pile, crushes differently with direction

And bombazine is kind of like corduroy but made from different materials.

Corduroy is made from cotton while bombazine is made from a silk and wool mix. This combination gave a softer and more subtle ribbed texture.

In the hands-on workshop next week, I will have velvet, corduroy and silk for you to touch and look at

Moire (watered silk)

Brocade

Velvet

Taffeta

Muslin

Bombazine

Here is what they look like.

I personally never heard of moire so I was very surprised to have learned something new also while doing the research for these guilds

Dyes & colours

1850s-1860s (Natural dyes still dominant):

- Pastels, earth tones
- Rich jewel tones for wealthy

1860s+ (Synthetic dyes arrive):

BRIGHT EVERYTHING

- Shocking pinks, electric blues, vivid greens
- "Arsenic green" (literally poisonous, fashion victims died)
- Black becomes VERY popular (cheap synthetic black dye)

By Class:

- **Upper:** Can afford changeability - whites (hard to clean), delicate pastels
- **Middle:** Respectable darks, modest brights
- **Working:** Dark colors (hide factory dirt), durable

Scheele's green
Or arsenic green

Mauvine

Arsenic green was so popular that people wore it knowing it was poisonous — which tells you something about how fashion worked.

For game design: you can justify almost any colour for a mid-to-late Victorian setting so you don't have to worry about historical accuracy for this one

Why this matters for games

Material variety: More textures than medieval = more visual interest

Colour options: Can justify almost any colour (synthetics existed)

Layering physics: Structured garments (corsets, bustles) = stiff underlayers

Steampunk license: Can mix materials creatively (leather + brass + fabric)

Structured garments mean you're simulating a rigid structure with fabric draped over it, not one piece of cloth. So you need to get creative to layer visually while still not overload on polygons

And steampunk gives you creative licence to mix materials in ways that feel grounded because the real period was already doing it.

Question for you

- Victorian women wore up to 8 layers.
- What do you think that does to cloth simulation?
- Does it behave like one piece of fabric or something else entirely?

Before I get into the construction and details of Victorian clothing I want to ask you what you think wearing 8 layers of cloth does to the behaviour of the outfit

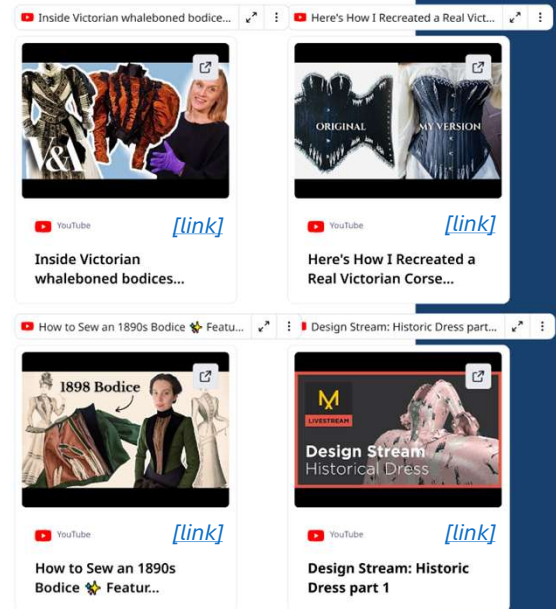

Construction & details

Section 5

Learn construction

Interesting videos about the construction of Victorian garments

Some interesting videos I encountered while researching for this guild, they show Victorian fashion from up close
And the marvelous video bottom left even creates a Victorian dress

Construction & details

Layering

From Skin Outward:

- 1. Chemise (soft, moves freely)
- 2. Drawers (soft, moves freely)
- 3. Corset (RIGID, doesn't move)
- 4. Corset cover (soft over rigid)
- 5. Petticoat(s) (rigid structures OR stiff fabric)
- 6. Dress (drapes over structured underlayers)
-
- **Result:** Outer dress deforms AROUND rigid structures, not with body

Layering is the core thing to understand.

You're not dressing a body, you're building outward from one.

The corset is RIGID and doesn't move. Everything above it drapes over that rigid structure. The body is almost irrelevant to how the outer silhouette behaves.

Construction & details

Structured skirt support

Crinoline Cage (1850s-60s):

- Steel hoops graduated sizes
- Fabric tapes connecting them

Animation:

- Swings as UNIT, not with legs
- Can flip up if bumped
- Springs back to shape
- Legs move INSIDE cage (independent)

1865 Cage crinoline & dress image

The animation logic is what matters for these structured skirts: the cage swings as a unit, can flip up if bumped, springs back to shape, and legs move inside it completely independently of the outer shape. Very different to simulating a normal skirt. if youre good with animating or working with game engines and making shapes interact, this seems like a super cool research project to me

Same background info: Before cage skirts, women wore petticoats which were skirts with a large amount of fabric layers. This got very hot and unhygienic. While cage skirts fixed this issue, they could be made even bigger but bigger meant not being able to fit through tight space, struggling to sit without revealing your ankles or causing fire when your skirt touched a fireplace.

Construction & details

Structured skirt support

Bustle (1870s-80s):

- Pad or wire frame at lower back
- All volume concentrated rear

Animation:

- Rigid at back, pulls fabric
- Creates overhang (fabric falls from bustle edge)
- Weight distribution changes walk

The bustle is another skirt support structure. All volume shifts to the back and the weight distribution changes how someone walked.

Detail construction

Pleats:

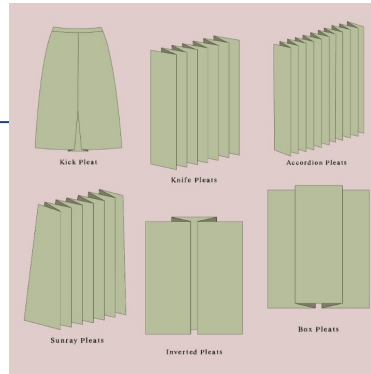

- Knife pleats (all facing one direction)
- Box pleats (two folds facing out)
- Cartridge pleats (tube pleats for volume)
- Pleats open when stressed, return to fold

Ruffles/Frills:

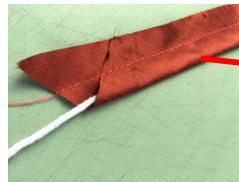

- Gathered fabric strip
- Sewn at one edge, other edge free
- Light, flutter easily, follow air movement

Piping/Trim:

- Cord covered in fabric
- Sewn into seams for emphasis
- Creates slight ridge, affects how seam folds

Learn all about
ruffles [\[link\]](#)

Source

Some details in construction worth mentioning are pleats ruffles and piping
 Pleats open under stress and return to fold
 Ruffles flutter and follow air movement
 And Piping at seams creates a slight ridge that reads differently in motion than a clean seam.

Closures

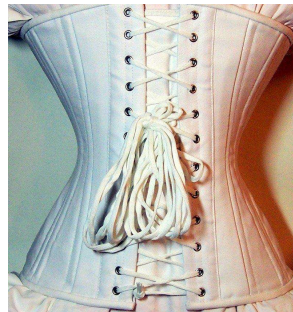

- **Hooks and Eyes** (hidden, strong)
- **Buttons** (decorative AND functional)
- **Lacing** (adjustable, often decorative)
- **Loop and studs** (front closing corsets)

< hook and eye

< buttons

^lacing

< loop and studs

The closure type tells a story.

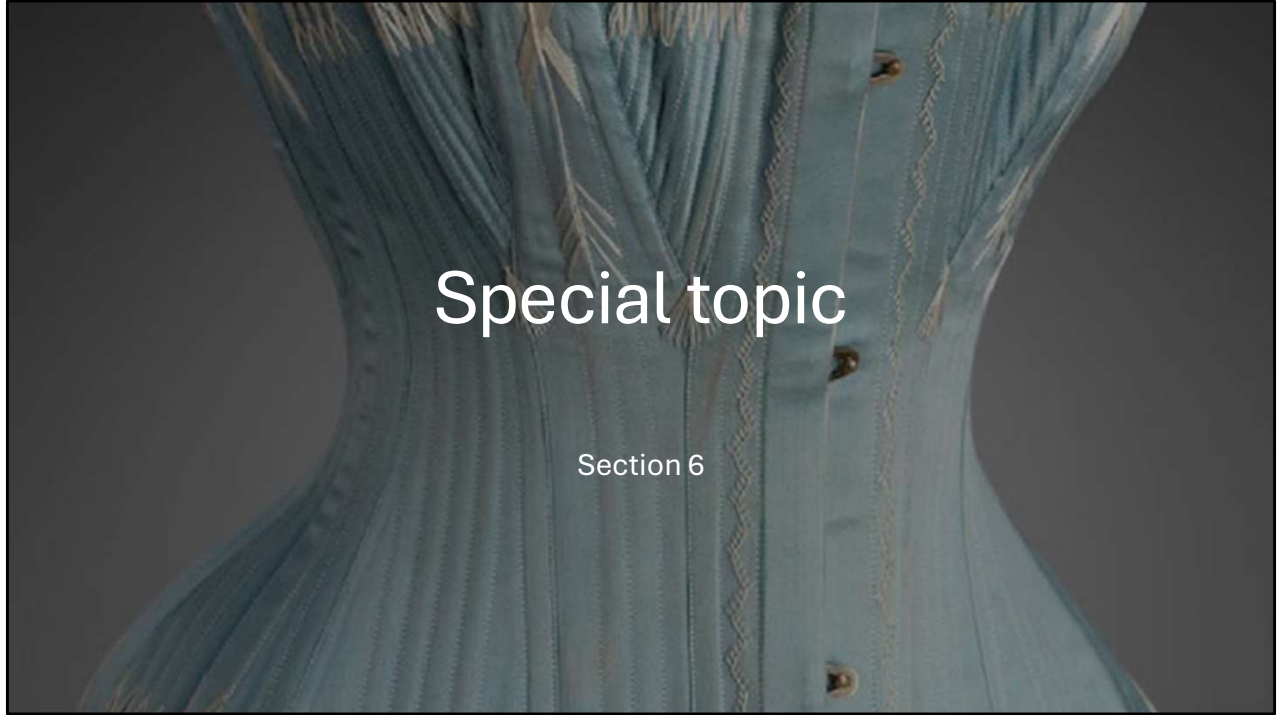

Loop-and-stud front fastenings were specifically designed so women could dress themselves without help.

If a character lives alone and has a back-laced corset, that's either a narrative choice or a costume error.

Question for you

- What do you already know about corsets?
- Does your knowledge come from history or from how the media has portrayed them?

So what is the corset actually?

Corset images

[Blue corset link](#)

[Cotton corset 1840](#)

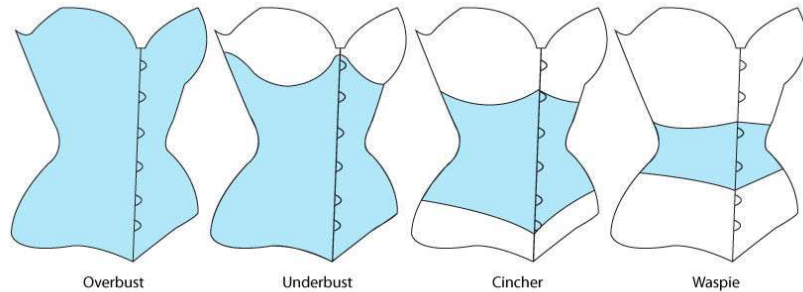

[White corset 1825](#)

There's different kinds of corsets, in this period the corset was still the only thing remotely close to a bra so it was to accentuate the waist but also support the breast area.

They often weren't as bad to wear as seen in period dramas and a lot of women actually really liked the support it gave

Names of corset types

An "overbust corset" encloses the torso, extending from just under the arms toward the hips.

An "underbust corset" begins just under the breasts and extends down toward the hips.

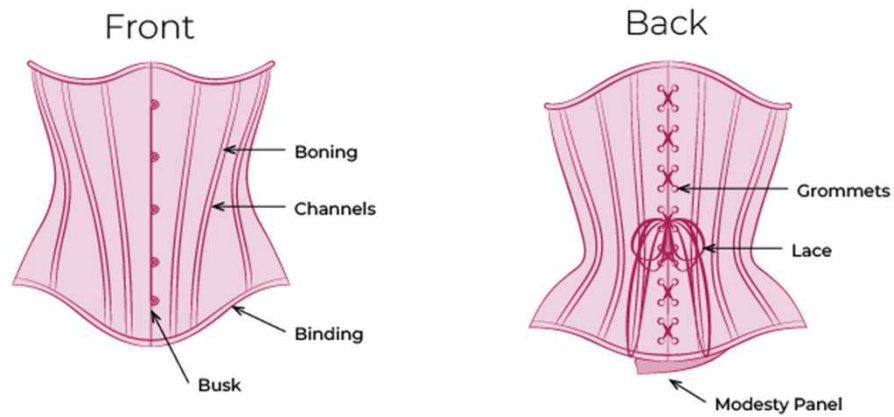

A "longline corset"—either overbust or underbust—extends past the iliac crest, or the hip bone

In terms of styles there are quite a lot, these ones are the most common
In the Victorian era, the overbust corset was most popular, either with or without shoulder straps. As I said before, this style specifically offers support to the breasts

Source three types link:

<https://en.wikipedia.org/wiki/Corset#:~:text=An%20%22overbust%20corset%22%20encloses%20the,crest%2C%20or%20the%20hip%20bone.>

Anatomy of a corset

The three most important things in a corset are the busks, boning and lacing.

Busks: are inserted in center front, from wood or metal, give a smooth line

Boning and cording through channels, and channels contain baleen (keratinous material from whale jaws)

Lacing: is done through metal eyelets/grommets

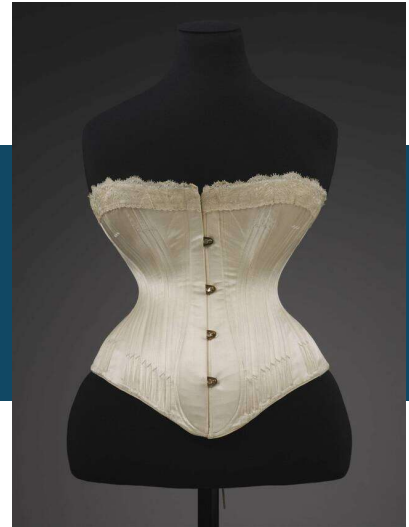

Lacing & fastening

Back lacing
Zigzag

Back lacing
Crisscross and meets in middle
For extra thin waist

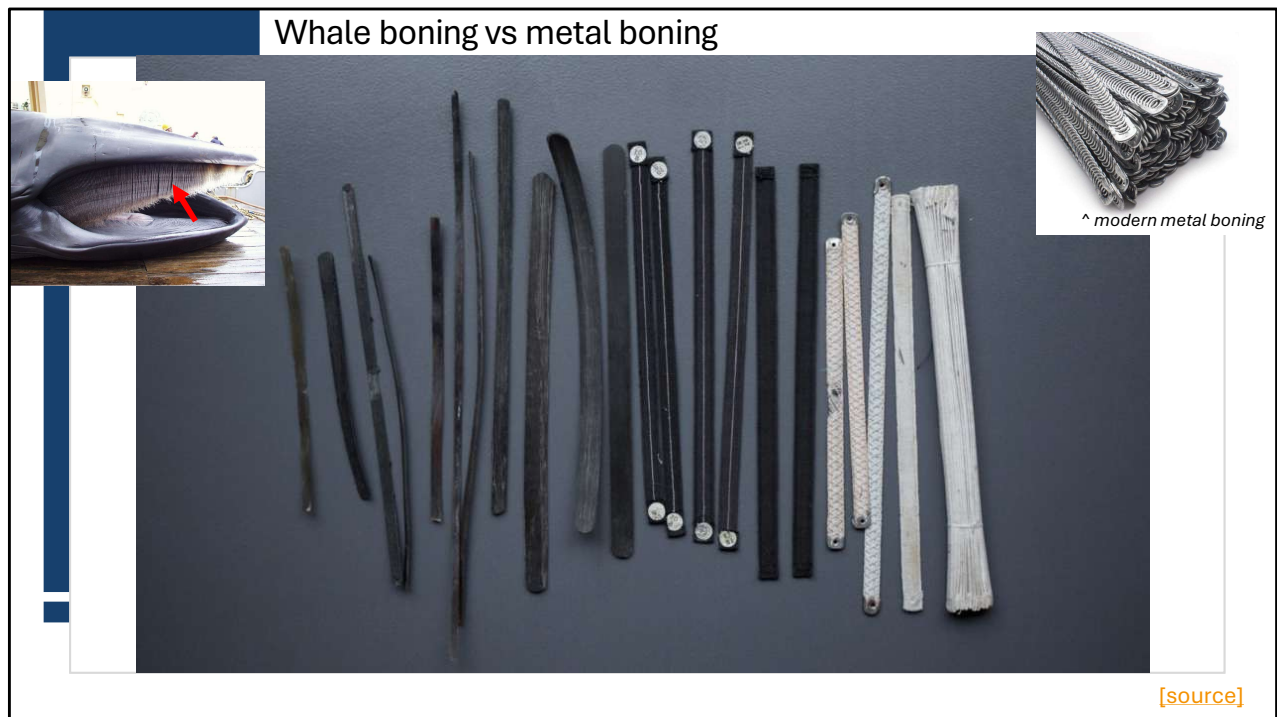

Center front fastening with split busks
Loop and stud front fastenings
Allowed women to dress themselves

Here are some different lacing types

They still laced zigzag but started to lace crisscross too. This allowed for even more tightening

And Loop and stud front fastenings Allowed women to dress themselves

These were often combined with a laced back, which would be laced once and then you could take it on and off yourself from the front

Boning goes inside boning channels to make the whole corset stiff
They used Whale baleen which was actually quite flexible yet very strong. So corsets weren't all that bad to wear as media portrays.
The hoop skirts and bustles were also made of baleen so it was possible to sit comfortably when wearing a corset and skirt.
But baleen kills whales so they transitioned to metal boning as corsets became more accessible due to industrialisation and they suddenly needed so much more boning

Boning channels

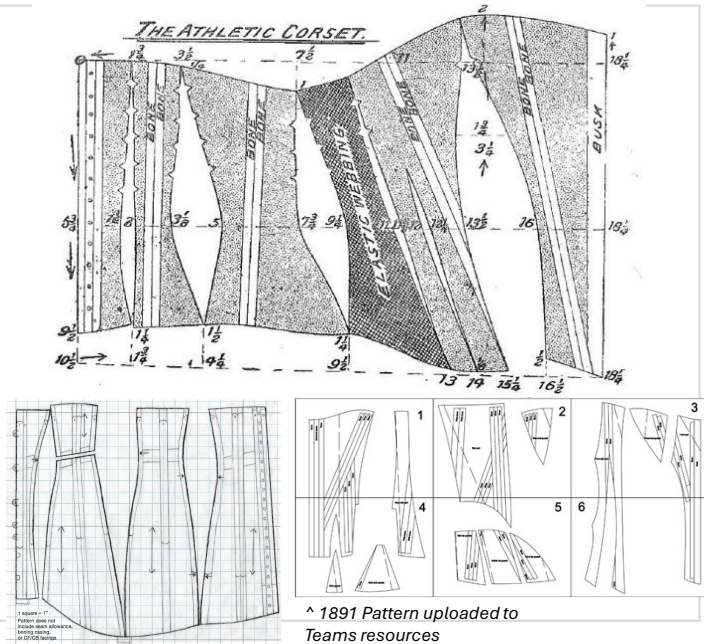

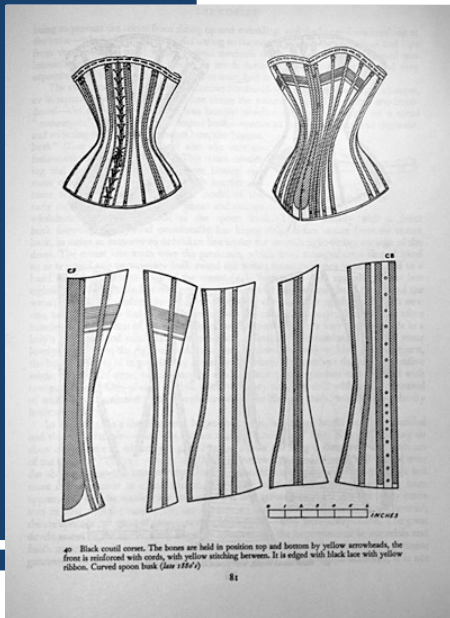

[source]

Here is a look at the boning channels.

Its basically a tunnel sewn into the garment or on top of seams in which you would slide boning

Corset patterns

The athletic corset

And here is a look at some Victorian corset patterns. See how small the waist is?

Health problems, deformities

But while wearing a well fitting corset could even be comfortable, many women went overboard and laced their corsets so tightly their skeletons deformed long term, their breathing was restricted which lead to fainting and often their organs were displaced.

Which made those patterns from the previous slide look so thin as their bodies were literally deformed

Game application

A lot of media do corsets wrong

^ Movie: Gladiator
Ancient Rome didn't have corsets

^ Movie: The Spanish princess
Misaligned spiral lacing

< Movie Camelot (2011)
Missing strengthening or
should've been spiral laced

These a whole bunch of movies and series where they made bad choices in terms of corsetry.

Here are some examples

In the top right you can see that they made eyelets spaced for crisscross lacing, but then laced it spiral and it shifted

Bottom right is crisscross laced which is historically incorrect, but it seems to be missing strengthening as the fabric is being pulled, this could've been fixed with spiral lacing

And bottom left, ancient rome didn't have Victorian styled corsets so that design choice was completely wrong

Game application

Witcher 3: Ciri's outfit >

Dragon's dogma 2 >

And some examples I found in games

Ciri's outfit features a underbust corset with no visible method of closure

Witcher 3 is medieval/renaissance and what she is wearing is from the future

In her time, wearing a corset over your normal clothing would mean you're wearing underwear. Shes also wearing pants which is also historically inaccurate but we will let that slide because her witcher job calls for it

Dragon dogma might not be a game that tries to be kind of historically accurate with garments but as this is a supposedly medieval world, these corsets are made and laced wrong. There was no crisscross lacing in medieval times

As a character artist you need to make choices between narrative serving and historical accuracy but these are clearly done for the male eye. Please design better.

Discussion & reflection

Section 7

Alright that was the end of the theory lets have a discussion and reflect on the information

Reflection prompt

Victorian clothing uses rigid structures underneath (corsets, cages, bustles).

Think about a character you're working on or a game you know:

- How would you approach drawing/creating a character with Victorian clothing?
- What specific technical challenge does this create?
- How might understanding the construction help you solve it?"

Reflection Prompt:

So Victorian clothing uses rigid structures underneath (corsets, cages, bustles).

Think about a character you're working on or a game you know:

How would you approach animating/simulating a character with structured Victorian clothing?

What specific technical challenge does this create?

How might understanding the construction help you solve it?"

Next guild:

Ancient to folk / cultural

Time flexible

Breaking the western (medieval) default

This is where creatures from mythology live

Thank you for being here today, the next guild will be about ancient, folk and different cultures

This time period is all over the place and breaks the western medieval default which I think is very interesting myself

This is also where creatures from mythology will live and if you dress them could take inspiration from
